

Monarch for Analysis, Business Intelligence, Business Objects, Data Architecture, Scorecards, and Dashboards

Having used Monarch to produce a system that produces analysis, business intelligence, business objects, data architecture, scorecards and dashboards etc. for an extremely inexpensive price, I am responding to your request for Monarch expertise.

Having used Monarch for more than 12 years with my copyrighted technique that strategically integrates the information used for decision making, I can do most of the work you need done from here in North Idaho.

Please see my website for examples of analysis, data architecture, scorecards and dashboards produced by my special technique. They are the result of integrating internal and external reports from finance, payroll, sales, production, distribution business system reports, and industry standards.

Because all the information I produce is reports based (referencing those reports), I can actually produce more useful information than the most expensive systems. Your management reports already describe your business objects. The secret is in the way my Information Heavylifting service pulls it all together by object and objective.

My website and resume show experience as a data modeler, data architect, database designer, and database manager with over twelve years experience producing monthly scorecards and weekly dashboards using my special technique.

Having tested my process in several types of large companies (from Insurance, to Medical Equipment Distribution, to a large medical group, to Aerospace Government Contracts, to State Government and State Government Agencies, and to Commercial Airplane), my modeling has spanned from the largest product business to the most complex service business.

I am interested in working with anyone who needs Monarch expertise for only \$50 per hour, but my complete service is called Information Heavylifting. For most large and small companies I can do this type work (making a very nice profit) for \$30,000 a year. My price depends not on the size of the company, but the number of people having time to request my services. For three customers my price doubles. However, even the largest company should only need one customer contact with whom I would work.

Please see [my website](#) for more information.

Robert D. (Bob) Pace
